Abstract:
In this paper, the investigation is conducted on the relationship between the number of fatalities by dint of traffic accidents and the gross municipal product, by using the panel data whose cross-sectional units are composed of municipalities in Fukuoka Prefecture in Japan. It turns out that the conventional quasi-differenced GMM estimator gives unconvincing results, while some of the GMM estimators proposed by Kitazawa (2007) give convincing results.

Keywords: traffic accident, number of fatalities, gross municipal product, count panel data, GMM
